

Farha Jawed

Problem 3: If you could change 1 thing about your favorite framework/**language**/platform (pick one), what would it be?

Response:

One thing I would like to change about my favorite language Java is unification of primitive types (e.g. *byte*, *short*, *int*, *long*, *float*, *double*, *Boolean*, *char*) and wrapper objects (*Byte*, *Short*, *Integer*, *Long*, *Float*, *Double*, *Boolean*, *Character*). It creates unnecessary confusion and complexity to have both *int* and *Integer* in the code. I would make all type names consistent and unify primitive type and wrapper objects. For example, I would like to convert *int* into a special value type, rename it to *Integer* and get rid of all wrapper classes.
